DETAILED ACTION

Response to Arguments

Applicant's arguments, see After Final Arguments, filed 4/29/10, with respect to the claims and cited art have been fully considered and are found persuasive. The rejections of claims have been withdrawn.

Allowable Subject Matter

Claims 1-18, 20-22 are allowed.

The following is a statement of reasons for the indication of allowable subject matter:

With respect to claim 1, though the prior art discloses:

An enclosed lens type retroreflective sheet comprising a surface layer including at least one layer, a focusing layer containing glass spheres, and a metal reflective layer on the back side of the focusing layer, wherein the glass spheres are disposed at random locations in the thickness direction of the focusing layer, ... , the focusing layer for the second glass sphere group is thinner at the glass spheres than a focus formation position for the glass spheres, the surface layer is present at positions over the first and second glass sphere groups, and the metal reflective layer is formed on the back side of the focusing layer to follow the shape of the glass spheres.

the prior art of record fails to teach or suggest the aforementioned combination further comprising:

the glass spheres include a first glass sphere group that provides reflective performance at a small observation angle of 2° or less and up to a large incidence angle of from 5° to less than 90° and a second glass sphere group that provides reflective performance at an observation angle greater than 2° and up to a large incidence angle of from 5° to less than 90° in the same focusing layer

The following is a statement of reasons for the indication of allowable subject matter:

With respect to claim 22, though the prior art discloses:

An external illumination system, comprising a sign having a sign face including an enclosed lens type retroreflective sheet comprising a surface layer including at least one layer, a focusing layer containing glass spheres, and a metal reflective layer on the back side of the focusing layer, wherein the glass spheres are disposed at random locations in the thickness direction of the focusing layer, ... , the focusing layer for the second glass sphere group is made thinner at the glass spheres than a focus formation position for the glass spheres, the surface layer is present at positions over the first and second glass sphere groups, and the metal reflective layer is formed on the back side of the focusing layer to follow the shape of the glass spheres, and an external illumination source, wherein the external illumination source is disposed at a fixed distance from the sign and the distance from the illumination source to the sign face is within a range of at least 1 m and no more than 100 m.

the prior art of record fails to teach or suggest the aforementioned combination further comprising:

the glass spheres include a first glass sphere group that provides reflective performance at a small observation angle of 2° or less and up to a large incidence angle of from 5° to less than 90° and a second glass sphere group that provides reflective performance at an observation angle greater than 2° and up to a large incidence angle of from 5° to less than 90° in the same focusing layer

With respect to claims 2-18, these claims depend on claim 1 and are allowable at least for the reasons stated *supra*.

With respect to claims 20-21, these claims depend on claim 22 and are allowable at least for the reasons stated *supra*.

Further, it is noted that the persuasive arguments are found to be additional reasons for allowance (REMARKS, p. 8):

Fig. 7 of Bailey shows reflective performance ONLY for an observation angle of 0.2° , and not an observation angle greater than 2° as the properties recited for the second glass sphere group in claims 1 and 22 require. The rejection's error in citing the value of 4° in column 7, line 39 as an indication of an observation angle greater than 2° , is clear since

Bailey describes this to be an incidence angle of 4° at column 7, line 39. Bailey's discussion of the incidence angle of 4° in no way describes any observation angles corresponding to an observation angle greater than 2° . See also Col. 6, line 8 of the reference. As seen in Fig. 7 of the reference, Bailey is evaluating reflective performance at varying incidence angles with only a constant observation angle of 0.2° , and does not evaluate reflective performance at an observation angle greater than 2° .

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
